

2020 SGRX National Formulary (Effective through 3/31/2020)

INTRODUCTION

The 2020 SGRX National Formulary serves as a reference and information tool for physicians, pharmacists and patients. The National Formulary is designed to assist practitioners in selecting clinically appropriate and cost-effective products for their patients. The drugs on this formulary have been clinically reviewed and evaluated.

This edition incorporates any drug changes to the formulary since the last edition. The National Formulary is reflective of current medical practice as of the date of review.

NOTICE

The information contained in this formulary and its appendices is provided solely for the convenience of medical providers. We do not warrant or assure accuracy of such information nor is it intended to be comprehensive in nature.

This formulary is not intended to be a substitute for the knowledge, expertise, skill and judgment of the medical provider in their choice of prescription drugs.

We assume no responsibility for the actions or omissions of any medical provider based upon reliance, in whole or in part, on the information contained herein. The medical providers should consult the drug manufacturer's product literature or standard reference for more detailed information.

PREFACE

The National Formulary may be administered as an open formulary. Plans may impose restrictions or not cover some products. In addition, over-the-counter (OTC) products, with the exception of insulin and diabetes monitoring products, are usually not included in the pharmacy benefit. OTC products are listed for informational purposes and only a representative product will be displayed.

PRODUCT SELECTION CRITERIA

The drugs selected on the formulary consider clinical information on new-to-market drugs that are typically included in an outpatient pharmacy benefit. The evaluation includes all or part of the following:

- Safety
- Efficacy
- Comparison studies
- Approved indications
- Adverse effects
- Contraindications/Warnings/Precautions
- Pharmacokinetics
- Patient administration/compliance considerations

When a new drug is considered for formulary inclusion, it will be reviewed relative to similar drugs currently included in the National Formulary.

We conduct a thorough evaluation of new drug approvals, generic competition, new research regarding current medications, improvement in member compliance, and improved clinical efficacy in the formulary management process. As standards of practice change and new information becomes available, products currently on the National Formulary will be reevaluated for continued inclusion or removal.

All the information in the National Formulary is provided as a reference for drug therapy selection. Specific drug selection for an individual patient rests solely with the prescriber.

GENERIC AVAILABILITY

Not all strengths or dosage forms of the listed generic name may be generically available. In some cases, the brand name listed is a generic drug.

GENERIC SUBSTITUTION

Generic substitution is a pharmacy action whereby a generic version is dispensed rather than a prescribed brand name product. An important consideration for generic substitution is the knowledge that all approvals of generic drugs by the FDA since 1984, and many generic approvals prior to 1984, have a showing of bioequivalence between the generic version and the reference brand product. To gain FDA approval:

1. The generic drug must contain the same active ingredient(s), be the same strength and the same dosage form as the brand name product.
2. The FDA has given the generic an "A" rating compared to the branded product indicating bioequivalence and has determined the generic is therapeutically equivalent to the reference brand. The ratings of generic drugs are available by referring to the FDA reference, Approved Drug Products with Therapeutic Equivalence Evaluations (Orange Book).

When the above two criteria are met, a generic can be substituted with the full expectation that the substituted product will produce the same clinical effect and safety profile as the prescribed product. Drug products that have a narrow therapeutic index (NTI) can also be guided by these principles. It is not necessary for the healthcare provider to approach any one therapeutic class of drug products (e.g., NTI drugs) differently from any other class, when there has been a determination of therapeutic equivalence by the FDA for the drug products under consideration. Also, additional clinical tests or examinations by the physician are not needed when a therapeutically equivalent generic drug product is substituted for the brand name product.

In addition to the "A" rated products, there are some marketed products that are "unrated". Unrated products are generally pre-1938 drugs that did not undergo the FDA review and approval process. Also, many cough and cold products and multivitamin products do not require FDA review. Most of these products would be suitable for

generic substitution. There are now many brand name products that are repackaged or distributed under a generic label. The generic label version should always be considered therapeutically equivalent and substitutable for the source branded product, irrespective of rating.

It is recommended that generic substitution not be exercised by the pharmacist with multisource products that appear in the Orange Book and carry a “B” rating, indicating that these products cannot be considered therapeutically equivalent to other products in the group. It is also recommended that generic substitution not be under taken for any unratred multisource products that might be considered narrow therapeutic index or maintenance drugs where it is known that unratred products from different labelers are not bioequivalent. State law or regulations may dictate the ability to practice generic substitution for selected products or categories of drugs.

DRUG EFFICACY STUDY IMPLEMENTATION (DESI) DRUGS

Drugs first marketed between 1938 and 1962 were approved as a safe but required no showing of effectiveness for FDA approval. Beginning in 1962, all new drugs were required to be both safe and effective before they could be marketed. This legislation also applied retroactively to all drugs approved as safe from 1938-1962. The DESI program was established by the FDA to review the effectiveness of these pre-1962 drugs for their labeled indications, and a determination of fully effective was made for most of these products and they remain in the marketplace. A few DESI products remain classified as “less than fully effective” while awaiting final administrative disposition. Also, classified as DESI are many products listed as identical, similar, or related to actual DESI products. Some plans will not pay for DESI “less than fully effective” drug products.

The drug names listed here are the registered and/or unregistered trademarks of third-party pharmaceutical companies unrelated to and unaffiliated with SGRX. These trademarked brand names are included here for informational purposes only and are not intended to imply or suggest any affiliation between SGRX and such third-party pharmaceutical companies.

NOTICE

The information contained in this document is proprietary information. The information may not be copied in whole or in part without the written permission of SGRX. All rights reserved.

KEY	For the member: Generic medications contain the same active ingredients as their corresponding brand-name medications, although they may look different in color or shape. They have been FDA-approved under strict standards.
[INJ] – Injectable Drug	
[OTC] – Over-the-counter Product	
Brand-name drugs are listed in CAPITAL letters. Example: CELEBREX	For the physician: Please prescribe preferred products and allow generic substitutions when medically appropriate.
Generic drugs are listed in lower-case letters. Example: ibuprofen
